I. Purpose

The intent of the Hot Work Program is to define the rules for performing “hot work” as outlined in OSHA 29 CFR 1910.252. These regulations will minimize the possibility of injury or property damage due to improper management of open flame/high temperature processes. See Appendix A for definitions.

II. Hot Work Permit

A. For any hot work that is performed in a location that is not designated as a hot work area, a hot work permit must be used. The Global Risk Consultants permit, which is used on campus, is shown in Appendix B. The Fire Safety Supervisor (FSS), who is to be designated by the Physical Facilities Director, must be notified and is responsible for checking the area for fire-safe working conditions. See Appendix C for fire safety precautions. The FSS is also responsible for making sure that stand-by fire extinguishers are present, assigning a fire watch when necessary, and making certain that all personnel in the area are properly warned of the work to be done. The FSS will then issue a Hot Work permit.

B. The fire safety Supervisor will identify on the hot work permit:
   - The location and nature of the hot work
   - The name of the person (employee or contractor) doing the job
   - The expiration date and time
   - The emergency notification procedures

C. The employee or contractor must submit the top copy of the permit to the FSS before work begins and hang the second page of the permit in a visible place in the work area; the permit is kept there until the job is completed, including the time allotted for the fire watch if one was needed. The first and second pages are the stapled together and filed in the maintenance shop.

D. A fire extinguisher or, if suitable, a water hose must be kept in the immediate area of the work.

E. The fire watcher observes the worker performing the hot work and keeps a constant vigil for stray sparks, ignition or other fire hazards. He/she must remain in the work area for at least a half hour after the work is done to check for smoldering fires.

F. If the hot work will be done in a confined space, all confined space entry procedures must also be followed.

G. The completed permit must be turned in at the end of the job to the Fire Safety Supervisor who files the records for the hot work program.
III. **Personal Protective Equipment**

Protection of the eyes, face, neck, and hands is required during any type of hot work. A welding helmet and heavy insulated gloves provide some of this protection. See Appendix D for shade requirements for various welding processes.

A. Only natural fiber clothing should be worn on the upper body extremities. A leather apron or full body leathers is recommended.

B. Respiratory protection is not required for most welding jobs if good ventilation is provided. Appendix E provides guidelines to assist in the determination of the need for respiratory protection.

C. Welding screens are required to protect adjacent workers from exposure to non-ionizing radiation. Adjacent workers are required to wear appropriate eye protection where screens are not feasible. Welder’s assistants or anyone working in the screened area must wear appropriate eye protection.

IV. **Contractors**

Contractors, their employees, agents and subcontractors must follow OSHA regulations that apply to their operation. If they do not have their own hot work program, the contractor must comply with the Montana Tech hot work program. In all cases, the Global Risk Consultants Hot Work Permit is used.

V. **Training**

Required training will provided initially to new employees and whenever conditions or the program changes.

*Updated December 2015*
Appendix A

Definitions

A. **Hot Work** refers to any job activity that uses or produces flames, sparks or heat that could act as an ignition source for any flammable liquid, gas or other combustible material in the area.

B. **Fire Watch** refers to having one or more people on the hot work job whose only purpose is to prevent a fire from starting from hot work performed in areas that are not designated as hot work areas or if any of the following conditions exist:
   - Noticeable combustible materials, in building construction or contents, are closer than 35 feet to the point of operation or are easily ignited by sparks;
   - Wall or floor openings within a 35-foot radius expose combustible material in nearby areas, including concealed spaces in walls or floors;
   - Combustible materials are adjacent to the opposite side of metal partitions, walls, ceilings or roofs and are likely to be ignited by conduction or radiation.

C. **Fire Watcher** refers to the person or persons who look for potential fires in all exposed areas during hot work and put out fires that are within the limits of the available fire extinguishers.
# HOT WORK PERMIT

**Before Initiating Hot Work, Ensure Precautions Are In Place!**

Make sure sprinklers are in service and fire extinguishers are readily available!

- There are no safer ways of effectively/efficiently doing this job.

## Instructions

- The Permit-Authorizing Individual must:
  - a) Verify precautions listed at right (or do not proceed with the work)
  - b) Complete and retain this page
  - c) Give the second page to the person doing the work.

## Who, When, and Where?

- **Hot Work Being Done By**
  - ☐ Employee
  - ☐ Contractor  

- **Date**

- **Job Number**

- **Location/Building and Floor**

- **Nature of Job/Object**

- **Name of Person Doing Hot Work**

- I verify the above location has been examined, the precautions checked on the Required Precautions Checklist have been taken to prevent fire, and permission is authorized for work.

- **Signature of Permit-Authorizing Individual**

## Required Precautions Checklist

- ☐ Available sprinklers, hose streams, and extinguishers are in service/operable
- ☐ Hot Work equipment in good repair

  **Requirements within a 35 foot “sphere” of work:**
  - ☐ Combustible dust or lint-producing equipment, fans, and conveyors isolated or shut down
  - ☐ Combustible/flammable materials removed, including: dust, lint, oil deposits (from all surfaces), packaging or stored materials, and flammable/combustible liquids.
  - ☐ Floor swept clean
  - ☐ Combustible floor wet down, covered with damp sand or fire-resistant sheets
  - ☐ Remove other combustibles where possible. Otherwise protect with fire-resistant tarpaulins or metal shields
  - ☐ All wall and floor openings covered
  - ☐ Fire-resistant tarpaulins suspended beneath work
  - ☐ Potentially hazardous atmosphere(s) eliminated?

**Work on walls/ceilings or enclosed equipment:**

- ☐ Construction is noncombustible. No combustible covering or insulation
- ☐ Combustibles on other side of walls moved away
- ☐ Enclosed equipment cleaned of all combustibles
- ☐ Containers purged of flammable liquids/vapors

**Fire watch/hot work area monitoring requirements:**

- ☐ Fire Watch will be provided during and for ___ minutes after work, including all coffee or lunch breaks
- ☐ Fire Watch is supplied with suitable extinguishers, charged small hose
- ☐ Fire Watch is trained in the use of this equipment and in sounding alarm
- ☐ Include additional watch for adjoining areas, above, or below
- ☐ Monitor hot work area periodically for ___ hours after job is completed

**Atmospheric Monitoring**

- ☐ Periodic atmospheric monitoring required?
  - Frequency: ___ Min.
  - Oxygen between 19.5% and 23.5%
  - Lower Explosive Limit less than ___ % LEL

**Other precautions taken:**

- ☐ Confined Space or Lockout/Tagout permit completed if needed
- ☐ Area smoke or heat detection had been disabled if present
- ☐ Other ___

## Permit Expiration

- **Expiration Date**

- **Expiration Time**
  - ☐ AM
  - ☐ PM

---

**This Permit is Good for One Day Only!**

WARNING!
Appendix C

Fire Safety Precautions for Hot Work

The following precautions should be taken before hot work begins:

1. Establish whether or not it is practical to move the work to a safer location.
2. Clear the area surrounding the work of hazards up to a 35-ft radius.
4. Where practical, stop other operations and processes involving flammable or combustible material.
5. Where practical, remove all flammable or combustible material from the work area; do not just seal the containers.
6. Cover combustible and flammable materials that cannot be removed with fire resistant material, and isolate the area with welding curtains, if practical.
7. Close all manhole covers or other openings in vessels that contain flammable liquids in the area.
8. Remove or protect all cylinders containing compressed gases in the area.
9. Close all doors and fire doors to prevent sparks from escaping.
10. Make sure automatic sprinkler protection is in service and fully operational, if available.
11. Keep hot work equipment in good repair. Check all hoses and their attachments for cracks and leaks.
12. When performing hot work on walls and ceilings, move combustibles away from the opposite side.
13. Evaluate all sewers within 50 ft. of the work area for the possibility of flammable vapors.
14. Isolate the hot work or ignition source work site from other hazardous areas. Close doors, seal cracks in walls, floors, and doors, and seal trenches.
15. Prohibit chlorinated solvents from use in or adjacent to all welding operations. Decomposition products such as phosgene can be formed as a result of the reaction of these solvent vapors with the radiation energy produced during welding operations.

Other alternatives to hot work should be considered if:

* Processes involving flammable liquids, gases and dusts cannot be shut down and made safe.
* Partitions, walls, ceilings or roofs have combustible coverings; for example, expanded plastic insulation.
* Partitions are made of combustible sandwich-type construction.
* Pipe or other metals can conduct enough heat to ignite nearby combustibles.
* Large amount of combustible materials is difficult to move or cover such as roll paper, cotton or jute storage.
